Maximum Average Grid Current . . . . .	30 MA.
Maximum Plate Voltage . . . . .	3000 Volts
Average Amplification Constant . . . . .	27

### INTERELECTRODE CAPACITANCES

Grid-Plate . . . . .	1.8 Mmfd.
Grid-Filament . . . . .	2.0 Mmfd.
Plate-Filament . . . . .	0.2 Mmfd.

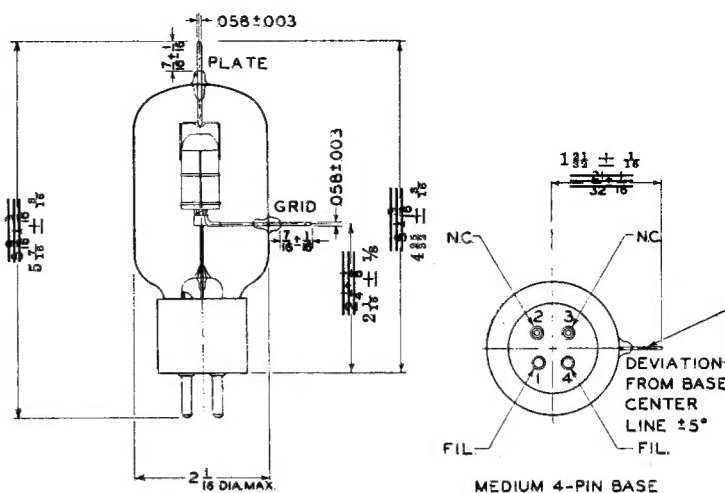

The Type 54 GAMMATRON has amazing power capabilities even though it is small in size. It has very low interelectrode capacities, and it employs a domed plate construction confining the entire electron stream at very high frequencies. Thus, no power is wasted, and the UHF efficiency is unequalled by ordinary tubes. Tantalum elements are cleaned and degassed by Heintz and Kaufman's new and improved pumping process. The "getter" is eliminated, internal insulators are not used, and thus GAMMATRON tubes do not become gassy because every source of gas has been removed.

The 54 GAMMATRON has unusual stamina and is very versatile. Its excellent characteristics suit it as a Class C amplifier for low or ultra high frequencies, Class B audio amplifier, frequency multiplier and crystal oscillator.

The tantalum plate is designed to run hot. Only a perceptible glow can be seen at 25 watts dissipation, and a dull cherry red color at 50 watts dissipation. This is normal, and no damage will result at this temperature. The convenience of the use of the plate color as an indication of proper circuit efficiency and tuning will be appreciated immediately after trying the 54 GAMMATRON.

## TYPE HK 54

The information on this and the following page does not represent exact conditions of operation to be imposed for any particular situation. Because tubes are used under many widely different conditions Heintz and Kaufman will gladly furnish information for applications which differ appreciably from the illustrative examples given.

### RADIO FREQUENCY POWER AMPLIFIER Class C UNMODULATED\*

# TYPICAL FINAL AMPLIFIER

This typical final amplifier is capable of a maximum output of 250 watts and requires a driving power of only 10 watts. A small receiving tube such as a 6V6-G is sufficient. It may be link-coupled to the grid circuit or directly coupled with  $C_5$  to the point on  $L_1$  which provides sufficient excitation. It is advisable to supply enough fixed bias to prevent plate current flow under static conditions (see plate curve), and the remaining bias is then developed by the grid current flow through  $R_g$ . Thus: DC grid voltage = Fixed Bias + ( $R_g \times$  DC grid current).

## COMPONENTS

- $C_1$  — .01 mfd mica, 1000 volt working.
- $C_2$  — 260 mmfd variable condenser, 1500 volt rating.
- $C_3$  — 200 mmfd per section, 4500 volt rating variable condenser.
- $C_4$  — .005 mfd mica, 5000 volt working.
- $C_5$  — .001 mfd mica, 2500 volt working.
- N.C. — Neutralizing condenser .7 to 4 mmfd.
- $J_1$  and  $J_2$  — Jacks to measure grid and cathode current.
- $R_g$  — As required.
- $T_1$  — 5.0 volt, 5 ampere filament transformer.
